Geometry Notes CG - 1: Slope

$$\text{Slope} = \frac{\text{rise}}{\text{run}}$$

$$m = \frac{y - y_1}{x - x_1}$$

Ex: Find the slope of the line through the points $(-3, 2)$ and $(3, -1)$.

$$m = \frac{y - y_1}{x - x_1} = \frac{-1 - 2}{3 - (-3)} = \frac{-3}{6} = \underline{\underline{-\frac{1}{2}}}$$

Four cases:

1. Positive \swarrow uphill
2. Negative \searrow downhill
3. Zero \longleftrightarrow horizontal $y = \#$ no x 's in equation
4. Undefined \updownarrow vertical $x = \#$ no y 's in equation

Ex: Find the slope of \overline{PQ} if $P(a, a + b)$ and $Q(5a, b - 2a)$

$$\begin{aligned}
 m &= \frac{y - y_1}{x - x_1} = \frac{b - 2a - (a + b)}{5a - a} = \frac{b - 2a - a - b}{5a - a} \\
 &= \frac{-3a}{4a} \\
 &= \underline{\underline{-\frac{3}{4}}}
 \end{aligned}$$

Geometry HW: CG - 1

1. Find the slope of each side of quadrilateral $ABCD$ shown $m = \frac{\text{rise}}{\text{run}}$ in the figure at right.

$$\overline{AB} = \text{zero}$$

$$\overline{BC} = \text{undefined}$$

$$\overline{DC} = \frac{-2}{6} = -\frac{1}{3}$$

$$\overline{DA} = \frac{6}{4} = \frac{3}{2}$$

2. Find the slope of the line segment joining each pair of points.

- a. $(-23, 39)$ and $(58, -15)$

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{-15 - 39}{58 - (-23)} = \frac{-54}{81} = \boxed{-\frac{2}{3}}$$

- b. $(a, 3a - b)$ and $(a + 2b, 3a - 5b)$

$$m = \frac{3a - 5b - (3a - b)}{a + 2b - a} = \frac{\cancel{3a} - 5b - \cancel{3a} + b}{2b} = \frac{-4b}{2b} = \boxed{-2}$$

3. Find the value of x so that the line passing through the points $(3, -2)$ and $(x, 6)$ will have an undefined slope.

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{6 - (-2)}{x - 3} = \frac{8}{x - 3} = 0 \quad \boxed{x = 3}$$

4. Find the value of k so that the line passing through $(3, -2)$ and $(3k + 5, k - 6)$ will have a slope of $3/2$.

$$m = \frac{k - 6 - (-2)}{3k + 5 - 3} = \frac{k - 4}{3k + 2} = \frac{3}{2}$$

$$2(k - 4) = 3(3k + 2)$$

$$2k - 8 = 9k + 6$$

$$-2k - 8 = 7k + 6$$

$$-14 = 7k$$

5. Find two values of a so that the line passing through $(a, 10)$ and $(7, a^2 - 3a)$ will have a slope of 0. $\boxed{k = -2}$

$$m = \frac{a^2 - 3a - 10}{7 - a} = 0$$

$$a^2 - 3a - 10 = 0$$

$$(a + 2)(a - 5) = 0$$

$$\boxed{a = -2} \quad \boxed{a = 5}$$

6. Determine if the three points $R(-7, -5)$, $S(5, 2)$ and $T(12, 6)$ are collinear. Justify your answer. (Think: If all three are on the same line, what must be true about the slopes of \overline{RS} and \overline{ST} ?)

$$\overline{RS} = \frac{-5-2}{-7-5} = \frac{-7}{-12} = \frac{7}{12} \quad \overline{ST} = \frac{6-2}{12-5} = \frac{4}{7}$$

No, Not collinear \rightarrow slopes not same

7. Find the value of x that will make the points $J(-4, 15)$, $K(x, 10)$ and $L(14, 3)$ collinear.

$$\overline{JL} = \frac{15-3}{-4-14} = \frac{12}{-18} = -\frac{2}{3}$$

$$-21 = 2(x-14)$$

$$\overline{KL} = \frac{10-3}{x-14} = \frac{7}{x-14} \neq -\frac{2}{3}$$

$$-21 = 2x - 28$$

$$\frac{7}{2} = \frac{2x}{2}$$

$$|x = 3.5|$$

8. A ladder 15 feet long leans against a vertical wall. The top of the ladder is 12 feet above the level ground. What is the slope of the ladder (assume it's positive)?

$$\begin{aligned} a^2 + b^2 &= c^2 \\ 12^2 + b^2 &= 15^2 \\ 144 + b^2 &= 225 \\ b^2 &= 81 \end{aligned}$$

$$m = \frac{\text{rise}}{\text{run}} = \frac{12}{9} = \boxed{\frac{4}{3}}$$

9. Tommy Hawk is building a skateboard ramp. He wants it to have a slope of $\frac{2}{7}$ and a vertical rise (height) of 5 feet.

- a. What horizontal distance will the ramp cover?

- b. How long will the actual ramp be?

$$\begin{aligned} \frac{2}{7} &\times \frac{5}{x} \\ \frac{2x}{7} &= \frac{35}{7} \\ 2x &= 35 \\ x &= 17.5 \end{aligned}$$

$$\begin{aligned} 5^2 + 17.5^2 &= b^2 \\ 25 + 306.25 &= b^2 \\ 331.25 &= b^2 \\ |18.2| \end{aligned}$$

10. A certain roof has a pitch (a builder's word for slope) of $\frac{5}{12}$ on each side. The entire roof is to be 32 feet wide. How high will the ridge line be above the attic floor?

$$\frac{5}{12} \times \frac{x}{16}$$

$$\begin{aligned} 80 &= 12x \\ |6.67 = x| \end{aligned}$$
